Other contacts

Internal:
Staff and Students at the University; colleagues in the School of Computing and Communications

External:
International collaborators

Major Duties:

1. Becoming familiar with the state-of-the-art research in distributed reinforcement learning, and in genetic improvement for real-time systems
2. Developing a novel distributed learning algorithm which scales well to hundreds of nodes, converges with high probability on a global reward, and can deal with very large search spaces across the system
3. Implementing the above solution and performing experiments to compare it against other approaches to demonstrate the range of design points and their impact on learning convergence
4. Developing a novel approach to transparent fault-tolerance for self-distributing systems, able to recovery from failures seamlessly without the system noticing that they occurred.
5. Implementing the above solution and performing a suitable range of experiments to demonstrate its properties and compare against the state of the art
6. Participation in national and international conferences and workshops to present the results of the project to a wider audience and to learn about current advances in the field.
7. Take a leading role in the scoping, planning and writing of conference and journal papers for publication of project findings.
8. Take a leading role in identifying funding opportunities and developing project proposals for future funding based on the research area and results of this project
9. Developing new research directions based on the above work, and carrying those directions through to successful new publications
10. Any other duties appropriate to the grade, as directed by the Principal Investigator or their representative
